## Abstract

A shower head with water purification function capable of easing restrictions on a shape, structure, and storage capacity of a water quality switching valve and also providing a well-balanced shape and structure for easier handling, wherein a

water quality purification cartridge is incorporated in a holding part, a purified water flow path passing through the water quality purification cartridge and a raw water flow path not passing through the cartridge are formed by the incorporation of that cartridge, a flow path switching valve which switches a flow path between the purified water flow path and the raw water flow path is incorporated in a head part, a straight delivery port is also provided at a place where the shower delivery port is formed, a delivery flow switching valve which switches a delivery flow between a delivery flow from the straight delivery port and a delivery flow from the shower delivery port is incorporated, and the flow path switching valve and the delivery flow switching valve are formed controllably from the outside of the head part

switching valve are formed controllably from the outside of the head part independently of each other.
